

**New amphipod species described in the period 1974-2006,  
ordered by family.**

**Wim Vader**

In AN 28 I have given an alphabetical listing of all new amphipod species and subspecies, that have been described in the period 1974 to 2004. Since then I have found three species I had overlooked, *Laetmatophilus paradurbanensis* Bano & Karmi, 2004, *Monoliropus hapipandi* Guerra-Garcia, 2004 and *Paracrangonyx winterbourni* Fenwick, 2001; no doubt there are more. Please let me know if you spot any! References to these three species, together with many described in 2005, can be found in AN 29, while most 2006 species are in AN 31.

Here I have ordered all species in taxonomic order, for ease of retrieval using the still customary alphabetical order of families and the same family allocations I used in AN 28 (but adding the changes proposed by Lowry 2006). As I explained there, I had in many cases to decide on family allocation, and my decisions no doubt will not please everyone, and may in some cases also be directly incorrect. Again, I hope that colleagues will help out with correcting mistakes both there, and also in the spelling of scientific names; I have only recently learned, for example, that it is no longer permitted to correct linguistically incorrect family names or other names above the genus level. I have used subfamily names in the case of the Lysianassoidea, the Corophiidea, and to a certain extent the Melitoidea and the Baikal amphipods, but not in families as the Amathillopsidae, the Pleustidae or the Phoxocephalidae, although also those recently have been divided into many subfamilies. In my opinion doing so would not greatly add the ease of data retrieval in these cases.

This is a listing of described species. In several cases those species have later been transferred to other genera or even synonymized. For example, several of the *Bathyporeia* species described in 1988, have later been put into synonymy, *Spindlerella groenlandica* turned out to be the juvenile of *Paramphithoe*, and *Regalia juliana*, described in 2005, was transferred to *Tepidopleustes* in the Pleustidae in 2006, at the same time as the type species of the genus *Regalia* was transferred to its own family, Regaliidae.

Such changes have not been noted here; this is strictly a listing of validly described species, with no data on their subsequent history

In order to find the primary reference to the descriptions of the new species, one needs to look up the species concerned in AN 28; there you will find in which newsletter the paper was first listed. For the species described in 2005 and 2006, and a few earlier inadvertently omitted, the references are in AN 29 and 31.

I am most grateful to Claude De Broyer, Traudl Krapp and Alan Myers for corrections to the original ms .
